**Title**

Use It or Lose It!: Results of a use study of the print sources in an academic library reference collection.

**Shortened title**

Use It or Lose It!: Results of a use study

**Abstract**

Describes a use study of a reference collection, which found that 7.1 percent of total volumes in the reference collection were used over the course of the fall semester.

**Introduction**

In the fall of 2010, the Reference Department at the University Library at the University at Albany, State University of New York, undertook a use study of the reference collection. Like many libraries, the University Library has added many online resources to the reference collection in the last decade, and has seen a decline in the use of print reference sources. The consensus among librarians working at the reference desk was that only a small portion of the collection was being used.

In the past, data on reference collection use had been collected but was limited to tracking the number of volumes reshelfed, with no title information gathered. Over the years, the collection has been weeded and reduced in size, but without the benefit of use data. In addition, given budget constraints during the last decade, it is more important than ever to spend acquisition funds wisely. Use data would help in making the best possible selection decisions, including the allocation of funds between print and online. Our goal is to have the reference collection be a dynamic, browsable collection

that is balanced, supports the current curriculum and the provision of reference services, and reflects changing usage patterns.

The University at Albany is one of four university centers in the State University of New York (SUNY) system, and has a student body of 13,100 undergraduates and 4,900 graduate students. The university offers a broad curriculum, with 57 undergraduate majors and 120 programs leading to master's and doctoral degrees.

Faculty and students at the University at Albany are served by three libraries. The University Library houses collections in the humanities and social sciences. The Science Library houses collections in science, mathematics, and technology, while the Dewey Graduate Library serves graduate students in social welfare, public policy and administration, criminal justice, and library and information studies.

This study sought to gather use data to answer three questions about the print reference collection at the University Library that would help in the management of the collection:

- To what extent is the collection used?
- Which subject areas receive the most use and which receive the least?
- What are the most frequently used titles?

### **Literature Review**

Based on the literature, it appears that use studies are not regularly undertaken by librarians. When Engeldinger surveyed academic libraries about their reference collection management practices, including weeding and use studies, only 6 percent

reported having conducted a use study of the reference collection (1986, p. 371). In a survey of academic libraries and their weeding practices, Biggs and Biggs found that less than 10 percent conducted use studies (1987, p. 74). Truett interviewed 14 academic and public libraries about their reference collection weeding and evaluation practices and found “little or no evidence that formal use studies were being conducted” (1990, p. 57). In a later survey of New York State academic and public libraries, only 12.3 percent of libraries reported regularly conducting use studies (Kessler, 2010, p. 38). While these surveys did not ask respondents why they did not conduct use studies, Engeldinger has postulated that many librarians may find use studies too time consuming and may believe that the data is not worth the effort. They may feel that informal observation is sufficient (1986).

Both Engeldinger and the Biggses concluded that librarians make weeding decisions based on subjective impressions of use. Engeldinger advocated maintaining an accurate and up-to-date reference collection through regular weeding and considered use studies essential to effective weeding, noting that “proper reference collection management requires more than subjective judgments” (1990, p. 119). The Biggses concluded that “reference collections tend to comprise more titles than, it would seem, librarians can efficiently manage either intellectually or physically and fully exploit in the course of daily reference service” (1987, p. 77).

The Biggses also asked about perceptions of reference collection use over different periods: one month, six months, one year, and five years. The mean estimate of reference collection use over a one-month period ranged from 18 – 23 percent, depending on the type of institution. Over a one-year period, the mean estimate of use

ranged from 43.5 percent to 49 percent, and over a five-year period, the mean estimate ranged from 62 to 70 percent.

While use studies do not seem to be popular, the library literature does contain a limited number of reports of use studies of reference collections at academic libraries in the past 25 years. All of the studies used some form of the reshelving method of measuring use, but differed in time periods, from a few weeks to five years. All those conducting use studies felt the process had been worthwhile and yielded useful and sometimes surprising data for collection development and management.

Arrigona and Mathews conducted a use study using the reshelving method for four weeks during the 1986 spring semester at Iowa State University. Their focus was on determining which subject areas received the most use and whether subject use differed between librarians and patrons. Only 21 percent of the volumes in the collection were used during the study period (1988, p. 77).

Engeldinger conducted a reshelving use study at the McIntyre Library at the University of Wisconsin-Eau Claire from 1981-1986. He found that 65.2 percent of the collection was used. However, 16.6 percent had only one recorded use in five years, and 34.8 percent of the collection had no use in five years. He concluded that despite their efforts to keep the collection lean and mean by annually reviewing each title, much of the collection still went unused (1990, p. 125).

As one tool in an overall assessment of the functionality of the reference collection at the William S. Carlson Library at the University of Toledo, Ohio, Sendi and colleagues conducted a reshelving use study over the course of one year, starting in the

fall of 1994. They gathered data on usage of separate collections: indexes, pamphlets, ready reference and regular reference. They found that 43 percent of the ready reference collection was not used (1996, p. 19). The article did not include data on the use of the entire reference collection.

Welch, Cauble, and Little detailed the results of their two-year (1994-1996) reshelving use study of print reference volumes at the J. Murrey Atkins Library at the University of North Carolina at Charlotte. They concluded that the study's use data were very helpful in making purchase and weeding decisions, but did not report an overall rate of usage of the reference collection.

From 1996 to 1997, librarians at the Health Sciences Library at the University of Maryland conducted a year long reshelving use study of the reference collection, and reported that 65.5 percent of the titles in the collection received use. They also noted that usage of the collection increased over time, and concluded that "if use data at a title level is desired, a lengthy study seems necessary," but that "a shorter term study could be considered if it were conducted during the busiest part of the year" (Fishman and DelBaglivo, 1998, p. 548).

The reference team at Stetson University's duPont-Ball Library conducted a reshelving use study for two two-month periods in 2003 and 2004. Bradford reported that only 8.5 percent of reference collection volumes were used in the study period (2005, p. 550). Combined with the results of another study done at Stetson which measured librarian use of the collection to answer reference questions at less than 2 percent, Bradford concludes that "while use is only one factor in assessing reference collections, certainly this study is a starting point for serious reappraisal of the size, the

scope of weeding needed, and budget allocations for future purchases for print reference sources” (2005, p 555).

Librarians at Columbia International University’s G. Allen Fleece Library conducted a five year reshelving use study beginning in 1999 in order to create a “lean, efficient reference collection.” They categorized items as heavily used (21–50 uses); moderately used (6-20 uses); and lightly used (1-5 uses). They found that 12 percent were heavily used, 17 percent were moderately used and 36 percent were lightly used, with 35 percent of the books having no use at all during the 5 year study. While not all of the collection received heavy use, the use of print reference books did increase by 40.4 percent over the five years of the study (Colson, 2007, p. 170-171).

### **The Reference Collection**

The print reference collection at the University Library, as of the writing of this article, contains approximately 26,000 volumes. Management of the collection is guided by a written collection development policy. The collection includes almanacs; annuals; yearbooks; bibliographies; biographical sources; concordances; dictionaries; directories; encyclopedias; geographical sources; handbooks, manuals, and guides; indexes and abstracts; and looseleaf services. Highly esoteric and narrowly focused sources, although they may be in a reference format, are included in the general collection.

Along with the print reference collection, the University Library has access to over 200 online databases and indexes, including key reference sources such as *Oxford Reference Online*, the *Oxford English Dictionary*, *Literature Resource Center*, *Britannica Online*, and a variety of subject encyclopedias in ebook format. The University Libraries also maintain a subscription to *Reference Universe*, an online master index to the table-

of-contents and indexes of reference books, which has helped reference librarians to identify useful titles in the print reference collection for patrons.

## **Methodology**

This study was conducted at the University Library during the fall 2010 semester. The fall semester is traditionally the busiest time of year for the Reference Services department in terms of reference questions and was therefore selected as the best time to gather reference collection usage data. The reshelving method of gathering data was employed.

The limitations of the reshelving method of collecting use data were outlined by Mary Biggs, with the primary one being that use is underestimated. She points out that “unobtrusive observation and other checks on users’ habits show that even when signs ask them not to do so, many people reshelve the books they consult, especially when they have used them for only a few minutes” (p. 106). She also notes that “figures may be deflated when two or more people use a book before it can be reshelved, scooping it up from a table or collection bin” (p. 107). Offsetting this understatement, volumes may be counted as used that were not, having fallen off the shelf or not been opened by the patron. In addition, measuring use by the reshelving method does not offer any information as to whether patrons found the information they needed.

The reshelving method has the advantages of not requiring participation from patrons, and being relatively simple to implement. It was decided not to alert patrons to the study by posting signage asking them not to reshelve books as this may cause them to become self-conscious about their behavior and act in uncharacteristic ways. The study was announced and discussed at library staff meetings.

Reference books were collected from reshelving bins and from tables and workstations by clerical staff and student workers. The library barcodes were scanned using a wireless barcode scanner before the books were reshelved. A small number of reference titles are on reserve and were excluded from the study. At the end of the semester, the file of barcodes was downloaded from the barcode scanner and a member of the Systems department created a report in Excel to include the title and call number.

One problem not uncovered until the report had been produced was that for some volumes, the ISBN barcode had been scanned instead of the library barcode. This problem was corrected by running a second report that matched against the ISBN field, and merging these results with those of the first report. Another problem not anticipated was that because the law collection is interfiled with the reference collection, the file of scanned barcodes included some volumes from the law collection, which had to be manually deleted from the final report, along with a small number of volumes that were not reference books.

## **Results**

There were 1,897 barcodes scanned during the project, of which 1,855 were matched to a catalog record. Of these, 31 law volumes and six volumes that were not reference books were eliminated from the results, along with 42 volumes that were not identifiable by ISBN or barcode. The final number of reference collection volumes analyzed was thus 1,818. Based on this number, the overall rate of usage of reference collection volumes during the fall 2010 semester was 7.1 percent.

Reference collection volumes used by LC class, the total number of reference collection volumes in each LC class, the percentage of volumes used in each LC class to the total usage, the percentage of volumes used in each LC class to the total volumes in that class, and the percentage of volumes in each LC class of the total number of volumes in the reference collection were calculated (see Appendix, Table 1). Usage by class ranged from a high of 745 for H, to zero for S and V. The two classes with the most usage, H and P, accounted for 58 percent of all use. Similar data by subclass for P and H was also calculated (See Appendix, Tables 2 and 3). In addition, the 25 most frequently used titles in the collection were compiled (see Appendix, Table 4). The *Routledge International Encyclopedia of Women* was the most used title of the semester, with 52 recorded uses. The top 25 titles accounted for 390 uses, or 21.5 percent of all reference collection use during the fall semester.

### **Discussion**

It is helpful to compare the percentage of each class' use to the total use with the percentage of each class' volumes to total volumes held. If reference collection selection was optimal, one would expect these numbers to be close. That is, the use in any particular class should mirror the representation of that class in the overall collection. After all, if we make significant purchases in a particular area, it is because we feel the materials are needed and will be used. If the use does not correspond, especially if there is a large difference, it would seem to indicate an imbalance in the collection and an area for further careful review in terms of weeding and future purchases.

However, when looking at the four classes with the most volumes, A, H, P, and Z, this is not the case. In three cases, A, P, and Z, the percentage of the class usage to the total usage is less than the percentage of volumes in that class to the total volumes in the collection. For example, the P volumes make up 26.6 percent of all volumes in

the reference collection, with 6,849 volumes. However, the usage of the P volumes (309) only accounts for 17 percent of all usage recorded.

This indicates that these sections are full of little-used volumes. To further pinpoint what is going unused, an analysis of each of these three classes was done. Looking at the breakdown for P, Romanic and English language dictionaries accounted for 15.9 percent of the P volumes (8.1 percent and 7.8 percent respectively), but their use accounted for 28.5 percent of the total volumes used. On the other hand, the 499 volumes of Slavic, Baltic, and Albanian language dictionaries constituted 7.3 percent of P volumes but 0 percent of P volumes used.

In contrast, H constituted 11.8 percent of the total volumes in the reference collection but accounted for 41 percent of recorded use. Since the University Library is a humanities and social sciences library, it is not surprising that this class would exhibit frequent usage. Three subclasses, HF, HM, and HQ, account for much more usage than their representation in the collection.

Many of the titles appearing on the most frequently used list in Table 4 are standard reference sources and were not unexpected, such as *Encyclopaedia Britannica*, *World Almanac and Book of Facts*, *World Book Encyclopedia*, *Diagnostic and Statistical Manual of Mental Disorders*, *Oxford English Dictionary*, and the *New York Times Index*. The top three titles were somewhat unexpected and accounted for 21 percent of the usage for the semester. Apart from the standard reference sources, the remaining volumes on the most frequently used list seem to be driven by assignments, and thus could vary from semester to semester. Unfortunately, no record was kept of large library assignments during the semester, which would have been helpful in analyzing these

results. Two of the titles (*Occupational Outlook Handbook* and the *Encyclopedia of Careers and Vocational Guidance*) are known to be useful for a recurring assignment on researching a career. It is likely that there was an assignment for which the *Routledge International Encyclopedia of Women* was a good, or required, source of information, along with the *Dictionary of Feminist Theory* and *A Feminist Dictionary*. *Masters Abstracts International*, the second most frequently used title, was also unexpected until we recalled that a graduate assistant had been assigned a project to confirm that the information in *Masters Abstracts International* is covered in the *Proquest Dissertations and Theses* database. The third most frequently used title was *Contemporary Authors*. The University Libraries have a subscription to *Literature Resource Center*, which includes the full text of *Contemporary Authors* so it was surprising to find so many uses of the print set. It may be that users are unaware of the online version, or they may prefer the print format.

What did not make the top 25 was also surprising. It was expected that the MLA, APA and Chicago style guides would appear on this list, but all had fewer than 6 uses. This appears to be a case of several patrons using these books before they were reshelfed, or patrons reshelfing the books themselves, because we know these volumes to be in very high demand.

As mentioned previously, the reshelfing method in general may result in undercounting usage. In this case, undercounting may have been exacerbated by our practice of pulling reference books useful for assignments in classes with large numbers of students and leaving them at the reference desk, since students return them directly to the reference desk, with the barcodes only being scanned on their final return to the

shelves. However, even allowing for a margin of error, a usage rate of 7.1 percent seems quite low.

While it is difficult to make comparisons between studies because of differences in methodology, the usage rate found in this study of 7.1 percent is comparable to the latest study done by Bradford in 2003-2004, which had a usage rate of 8.5 percent over four weeks. It is significantly lower than the Engeldinger, Fishman and DelBaglivo, and Colson studies. These studies were all conducted over longer periods of time, and the Engeldinger and Fishman and DelBaglivo studies were done over a decade ago. One would expect usage to be higher the longer the period of study, and there is a much greater reliance Web-based reference sources now than there was at the time these studies were done.

This study has provided much useful data for managing the reference collection. It is clear that there are several areas in which sources do not get used and which could be weeded or relocated without impacting the provision of reference service or inconveniencing patrons. Collecting data has allowed us to pinpoint areas to review, and to investigate what has caused the low use. Collecting data has allowed us to pinpoint areas to review, and to investigate what has caused the low use. If use in a class is low in comparison to the volumes held in that class, it could be that the best sources are now online, that fewer courses are being offered in the subject, or that the sources in the collection are outdated or inappropriate. Determining this allows us to take corrective action, whether it be weeding the class, purchasing updated sources, switching to online sources, or deciding to purchase fewer titles in that class in the future.

Opinions will vary on what is an acceptable rate of usage for a reference collection, but a very low rate such as the 7.1 percent found in this study argues for a thorough review of the collection. Traditionally, one of the main criteria for including an item in reference collections was frequency of use. The reference collection development policy for the University Library reference collection states that usefulness to librarians and patrons is the principal criterion for inclusion in the reference collection, and that seldom used sources should not be included in the collection, even though they may be arranged in a reference type of format. Thus, if we were to abide by our own collection development guidelines, significant weeding would be done.

Of course, unused does not necessarily mean useless. Some materials may be discarded as outdated, but many sources may benefit from being moved to the stacks where they are more likely to be discovered by browsing patrons. Many academic libraries have begun to interfile references sources with the general collection.

Librarians have an obligation to spend limited funds as wisely as possible, and that may require frequent changes in funding allocations and purchasing patterns, along with vigilant attention to usage data. The low usage rate of print reference sources is one rationale for reallocating funds to online sources. Bradford has argued that “reference budgets must now be stretched to accommodate expensive electronic sources most of which have an administrative mechanism for tracking use statistics. Use of the print collection should likewise be monitored so that the percentage of the reference budget spent on print sources mirrors the extent of its use.” (p. 547)

### **Further Research**

The use data gathered in this study, while enlightening and helpful, is a snapshot in time and thus may not represent a complete usage pattern of the reference collection. Gathering data over a longer period of time, or continuously, would be ideal. Because

the use data was easily gathered and so helpful, the decision was made to continue to collect it on an ongoing basis. In addition, when the scanned barcodes are used to create a report, the publication year for each source will be included, giving some measure of currency of the sources consulted. Keeping track of large assignments and the reference sources selected by librarians for these assignments will also help to interpret the use study results.

Given that most academic library reference collections now include both print and online sources, it would be interesting to compare their usage. In general online sources are more expensive, but does this online convenience result in more usage than print sources?

### **Conclusion**

This low rate of usage of reference collection volumes leads to the larger question of what the reference collection of the 21<sup>st</sup> century academic library should look like. Because so much factual information is available on the Web and many standard references sources are now available online, many print reference sources that used to be consulted regularly are no longer needed. Tycokson has questioned the need to maintain a print reference collection and believes that “over time the reference collection will wither away.” (2004, p. 38) Certainly reference collections must evolve in order to meet the evolving needs and preferences of patrons, changes in publishing, and the changing methods of delivering reference services.
